

MOHS SURGERY

SKIN CANCER TREATMENT

OSWALD LIGHTSEY MIKELL, MD
American Board of Dermatology
American Board of Cosmetic Surgery
Physician of the Year 2008*

**Awarded by the S.C. Dermatological Assoc.*

Mohs micrographic surgery, a state-of-the-art procedure has come to be accepted as the single most effective technique for removing skin cancers. It's both unique and precise in that instead of removing the whole clinically visible tumor and a large area of normal-appearing skin around it, the Mohs surgeon removes the minimum amount of healthy tissue while totally removing the cancer.

Mohs is performed by dermatologic surgeons who are experienced and trained in surgery and pathology of skin tumors, and in reconstruction.

Oswald Lightsey Mikell, MD is a Fellow of the American Society for Mohs Micrographic Surgery, and double-board certified by both the American Board of Dermatology and the American Board of Cosmetic Surgery.
